## Due at the beginning of class on 11 February 2024

NAME: SOLUTIONS

- Your answers should be neatly written and logically organized.
- You may collaborate on solving the problems, but the solutions you turn in should be your own.
- You may use any resource you find online (or elsewhere), but you must cite any resource you use.

## **Reading:** Read §2.2 in [Rie14] and §1.5 in [Mal23].

(1) Let  $\mathcal{C}$  be a homotopical category, and let  $\mathcal{I}$  be any category. The category  $\text{Fun}(\mathcal{I},\mathcal{C})$  of functors from  $\mathcal{I}$  to  $\mathcal{C}$  becomes a homotopical category with weak equivalences defined object-wise. By choosing a homotopical category  $\mathcal{C}$  and a category  $\mathcal{I}$ , show that the limit functor

lim: Fun(
$$\mathfrak{I},\mathfrak{C}$$
)  $\to \mathfrak{C}$ ,  $F \mapsto \lim F$ 

is not a homotopical functor.

SOLUTION: Plenty of examples. Homotopy pullbacks are not pullbacks.  $S^1 \times_* S^1$  is a torus, but  $S^1 \times_{D^2} S^1$  is homeomorphic to  $S^1$ .

(2) Let  $\mathcal{C}$  be a homotopical category. Prove that for any discrete (the only morphisms are identities) category  $\mathcal{I}$  with finitely many objects,  $\mathsf{ho}(\mathcal{C})^{\mathcal{I}}$  is equivalent to  $\mathsf{ho}(\mathcal{C}^{\mathcal{I}})$ , where  $\mathcal{C}^{\mathcal{I}}$  has weak equivalences defined pointwise. Prove that finite products in  $\mathsf{ho}(\mathcal{C})$  are homotopy coproducts in  $\mathsf{ho}(\mathcal{C})$  are homotopy coproducts.

## SOLUTION:

You need to assume that  $\mathfrak I$  is finite (or maybe a model category), otherwise you get bad behavior. For example, if  $\mathfrak C$  has one object and two morphisms  $\mathfrak f$  and  $\mathfrak g$  and you invert  $\mathfrak g$ . Let  $\mathfrak I$  be the integers. In  $\mathsf{ho}(\mathfrak C)^{\mathfrak I}$  has morphisms of the form  $(\mathfrak f, \mathfrak f \mathfrak g^{-1} \mathfrak f, \mathfrak f \mathfrak g^{-1} \mathfrak f \mathfrak g^{-1} \mathfrak f, \ldots)$ , but this is not a morphism in  $\mathsf{ho}(\mathfrak C^{\mathfrak I})$ . The problem is that there are different lengths of zigzags at different objects of  $\mathfrak I$ .

Let  $L: \mathcal{C} \to \text{ho } \mathcal{C}$  be the localization functor. Then  $L^{\mathfrak{I}}: \mathcal{C}^{\mathfrak{I}} \to (\text{ho } \mathcal{C})^{\mathfrak{I}}$  is a functor which sends weak equivalences to isomorphisms. This yields a functor  $\text{ho}(\mathcal{C}^{\mathfrak{I}}) \to (\text{ho } \mathcal{C})^{\mathfrak{I}}$ . By construction, this functor is bijective on objects. Further, it is faithful, for it sends a zig-zag of tuples of morphisms to the corresponding tuple of zig-zags of morphisms.

We need additional assumptions to guarantee that this functor is full. If  $\mathfrak I$  is finite, then the supremum of lengths of zig-zags accuring in an  $\mathfrak I$ -indexed tuple is finite, and thus arises from a zig-zag of tuples. Otherwise, if  $\mathfrak C$  is a model category (or more generally has an  $\mathfrak n$ -step calculus of fractions), the supremum of lengths accuring in a zig-zag of  $\mathfrak I$ -indexed tuples is again finite, and thus arises from a zig-zag of tuples.

Assume this functor is full. Then,  $ho(\mathfrak{C}^{\mathfrak{I}}) \to (ho\,\mathfrak{C})^{\mathfrak{I}}$  is an equivalence (even an isomorphism, although it is forbidden to acknowledge that some functors are isomorphisms).

Assume that  $\mathcal{C}$  has homotopy products and ho  $\mathcal{C}$  has products. Then, the homotopy product functor  $ho(\mathcal{C}^{\mathfrak{I}}) \to ho \, \mathcal{C}$  is the right derived functor of the product  $\mathcal{C}^{\mathfrak{I}} \to \mathcal{C}$ . By the previous problem set, this is the adjoint of the left derived functor of the diagonal,  $\mathcal{C} \to \mathcal{C}^{\mathfrak{I}}$ . Since the diagonal is already homotopical, its left derived functor is again the diagonal  $ho(\mathcal{C})^{\mathfrak{I}} \to ho \, \mathcal{C}$  after identifying  $ho(\mathcal{C}^{\mathfrak{I}})$  and  $(ho\,\mathcal{C})^{\mathfrak{I}}$ . But the adjoint to this diagonal is exactly the homotopy product in ho  $\mathcal{C}$ . See also [Rie14, Remark 6.3.1 and footnote 3 therein].

- (3) A *coequalizer* is the colimit of a diagram of shape  $\bullet \Rightarrow \bullet$  in a category.
  - (a) Prove that the data of the coequalizer of two parallel morphisms  $A \xrightarrow{f \ g} B$  is equivalent to the data of the pushout of the diagram

$$A \stackrel{\nabla}{\longleftarrow} A \coprod A \stackrel{(f,g)}{\longrightarrow} B$$
,

where  $\nabla \colon A \coprod A \to A$  is the fold map.

SOLUTION: We will show that each object has the universal property of the other. First, assume that P is a pushout in the diagram below

$$\begin{array}{ccc}
A \coprod A \xrightarrow{(f,g)} & B \\
\downarrow \nabla & & \downarrow p \\
A \xrightarrow{q} & P
\end{array}$$

First, claim that p equalizes f and g. To see this, consider the composite  $p(f, g)i_1$ , where  $i_1: A \rightarrow A \coprod A$  is the left injection into the coproduct. We have  $(f, g)i_1 = f$ , and  $\nabla i_1 = id_A$ . Then:

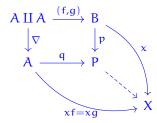

$$pf = p(f, g)i_1 = q\nabla i_1 = q$$

Similarly,  $(f, g)i_2 = g$  and  $\nabla i_2 = id_A$ , so:

$$pg = p(f, g)i_2 = q\nabla i_2 = q$$

So pf = pg. So p equalizes f and g. It remains to be seen that it is the universal morphism that does so.

Let  $x: B \to X$  be any morphism such that xf = xg. Then  $x(f,g)i_1 = xf = xg = x(f,g)i_2$ , which is the same as  $x(f,g) = xf\nabla = xg\nabla$ . Then we can draw a commuting diagram

and fill it in with the dashed arrow, which shows that there is a unique morphism  $P \to X$  exhibiting P as the coequalizer of f and g.

The converse is similar.

(b) Use part (a) to describe the homotopy coequalizer of two maps in the category Top of (unpointed) topological spaces<sup>1</sup>.

SOLUTION: The homotopy coequalizer of two parallel maps f, g:  $X \rightarrow Y$  is the mapping torus

$$X \times [0,1] \sqcup Y/\sim$$

where ~ identifies

$$(x,0) \sim f(x) \text{ and } (x,1) \sim g(x).$$

<sup>&</sup>lt;sup>1</sup>To be precise, we assume all spaces are compactly generated and weakly Hausdorff. Or equivalently, assume that all spaces are homotopy equivalent to a CW complex.
